CHROMOSOME NUMBERS IN ANGIOSPERMS IV

BY

L. O. GAISER

Manuscript received August 1932

In preparing this annual publication of chromosome numbers in angiosperms, any papers published earlier than 1930 and not included in previous lists (GAISER 1926, 1930*a*, 1930*b*) have been first assembled in the supplement. Thus the main list consists entirely of reports published in 1930.

The same method of arrangement as had been used previously has again been followed here.

Reports of chromosome numbers published in 1931 and 1932 will be published pointly after the completion of the latter.

L. O. GAISER

CHROMOSOME NUMBERS IN ANGIOSPERMS III

Genetica XII, 1930

ERRATA

- Page 176 — *Malus coronaria* MILL., $n = 34$, $2n = 68$, NEBEL, 1929b.
Malus prunifolia BORKH., $2n = 51$ instead of 102, NEBEL, 1929b.
- Page 185 — *Linum usitatissimum*, $n = 16$ instead of 6, INOUE, 1929.
- Page 188 — Include CHRISTOFF, 1929 after *Vitis riparia grand glabre*.
Vitis vinifera var. *Grand noir d. la c.*, $2n = 38$, NEGRUL, 1929 instead of 1928.
- Page 190 — Seibel 28 should be Seibel 128.
Insert *Vitis Chasselas* \times *Berlandieri* 41B., $2n = 28$, NEGRUL, 1929.
Insert *Vitis riparia* \times *Gamay* (Oberlin 595), $2n = 38$, NEGRUL, 1929.
- Page 191 — Insert for *Vitis riparia* \times *V. vinifera* var. *Gamay* 595 Oberlin, $2n = 38$, NEGRUL, 1929.
- Page 223 — *Panicum dichotomiflorum* MICHX. to *P. scribnerianum* NASH are by CHURCH, 1929b instead of RAU, 1929a.
- Page 239 — Omit $n = 12$ for *Rhoco discolor*, DARLINGTON, 1929e.
- Page 240 — *Hemerocallis fulva*, clon *Europa*, chromosome number by SROUT and SUSA, 1929, *Hemerocallis longituba* and following by TAKENAKA, 1929.
- Page 243 — *Muscari* species should be on page 242 before *Yucca filamentosa*.
- Page 245 — Insert *Iris susiana*, $2n = 20$, SIMONET, 1929c.
For *Iris Alberti* REGEL, $n = 12$ instead of $2n = 12$, SIMONET, 1929d.

CHROMOSOME NUMBERS IN ANGIOSPERMS II

Bibliographia Genetica VI, 1930

ADDITIONAL ERRATA ¹⁾

- Page 220 — *Pirus malus* var. *Canadian Reinette*, $2n = 51$ instead of 15, RYBIN, 1927a.
- Page 239 — *Prunus nivea* MIYASHI, $n = 16$, OKABE, 1927, but $n = 24$, OKABE, 1928.

¹⁾ See also Genetica XII, 1930.

- Page 263 — Insert *Viola Humboldtii* TR. et PL., $n = 27$, HEILBORN, 1926.
Insert *Viola riviniana* RCHB., $n = 20$, CLAUSEN, 1927b.
- Page 289 — Insert *Primula Forbesii*, $n = 9$, SUGIURA, 1928a.
Primula officinalis, $n = 9$, instead of 11, MARCHAL, 1920.
- Page 322 — The two last species of *Sambucus* should be *Lonicera alseuosmoides* GRAEB. and *L. stabiana* GUSS., DE VILMORIN & SIMONET, 1927b.
Bryonia dioica, $n = 12$ instead of 10, STRASBURGER, 1910c and *Bryonia dioica* JACQ, $n = 10$ instead of 12, MEURMAN 1925b.
- Page 324 — *Cucurbita pepo*, $n = 12$ instead of 14, LUNDEGARDH, 1914.
- Page 330 — *Calendula officinalis*, $2n = 28$ instead of 24, LUNDEGARDH, 1909.
- Pages 390, 391 — *Lilium Kolpakowsiana* REGEL etc. to L. sp. (?) Murillo (hort.) should be *Tulipa*.
- Page 394 — Chromosome numbers for *Ornithogalum narbonense*, *O. nutans*, *O. pyrenaicum* and *O. umbellatum*, SPRUMONT, 1928 should be in the $2n$ instead of the n column.
- Page 400 — Insert $2n = 12$, for *Yucca glauca*, FOLSOM, 1916.
- Page 411 — *Cypripedium insignis*, $2n = 24-26$ instead of 24-36, HEITZ, 1926.
- Page 412 — *Ionopsidium acaule* RCHB., $n = 12$, $2n = 24$, CHIARUGI, 1928.
" *Savianum* (CAR.) BALL., $n = 16$, $2n = 32$, CHIARUGI, 1928
should be transferred to page 204 before *Iberis amara*.

¹⁾ In the male plants there are usually 7 pairs of autosomes and a tripartite sex chromosome ($y_1 \times y_2$). In one male plant there were found 6 bivalents and a pentapartite chromosome complex consisting of a pair of autosomes and the 3 sex chromosomes ($y_1, s \times y_2$).

²⁾ In the male and male intersexual plants there occurred an XY pair of chromosomes and in the female and female intersexual plants an XX pair.

„ <i>ovata</i> K. KOCH.	16	„ „
× <i>Pterocarya Rehderiana</i> SCHNEID. (<i>P. fraxinifolia</i> × <i>P. stenoptera</i>)	16 ⁴⁾	„ „

¹⁾ Reduction division in the pollen-mother-cells was very irregular. In the embryo-sac mother-cell there were either many bivalents with some univalents or all the chromosomes appeared as univalents and no reduction of number followed.

²⁾ Meiosis was very irregular.

³⁾ Meiosis was not normal.

⁴⁾ Meiosis was irregular.

× „ <i>purpurii</i> SCHNEID. (<i>B. lutea</i> × <i>B. pumila</i> var. <i>glandulifera</i>)	45 ³⁾	„ „

¹⁾ Meiosis was very abnormal. Some of the chromosomes did not pair in diakinesis.

²⁾ *Betula lutea* reported on by WOODWORTH, 1929a (see GAISER, 1930b) came from Massachusetts (U. S. A.)

³⁾ Meiosis was very abnormal.

QUERCUS (unclassified as to sub- genus)				
<i>Quercus borealis maxima</i> ASHE ⁶⁾		12		FRIESNER, 1930.

¹⁾ Only 25 units were counted in metaphase, one unit supposedly consisting of 3 fused units.

²⁾ This number was determined in the ovule where no reduction division was found to occur (embryos arising from parthenogenesis).

³⁾ Meiotic divisions were more or less irregular.

⁴⁾ Equatorial plates showing 10 and 11 chromosomes were explained as having been the result of fusion of chromosomes.

⁵⁾ Mitotic chromosome behavior was somewhat abnormal.

⁶⁾ Mitotic chromosome behavior was slightly abnormal.

¹⁾ Mitotic chromosome behavior was somewhat abnormal.

²⁾ Equatorial plates showing 10 and 11 chromosomes were explained as having been the result of fusion of chromosomes.

³⁾ Judged by meiotic divisions where 13 or 14 chromosomes were found and it was thought that several univalent chromosomes were present.

⁴⁾ See foot-note 6 page 122.

⁵⁾ The trivalent chromosome is represented as $a + b_1 + b_2$.

⁶⁾ Tetraploid cells occurred occasionally in the diploid plants.

„ <i>montanus</i> ♀		14 ²⁾	„ „

¹⁾ The complex is written $15 = x + 2y + 12a$.

²⁾ The complex is written $14 = 2x + 12a$.

³⁾ The complex is written $15 = x + 2y + a' + 11a$. The a' chromosome is one of a heteromorphic pair, apparent in certain division stages.

⁴⁾ The complex is written $22 = 2x + 2y + 18a$ or $2x + 2y + a' + 17a$, of which those having the a' chromosome show greater degrees of intersexualism. Of four other plants showing marked intersexualism the complex was $2x + 3y + a' + 16a$ or $2x + 2y + 3a' + 15a$.

⁵⁾ The complex is written $29 = 3x + 2y + 24a$.

⁶⁾ The complex is written $15 = x + 3y + 2a' + 9a$ or $2x + 13a$; $16 = x + 2y + 13a$; and $20 = 2x + y + 17a$.

¹⁾ The complex is written $22 = 2x + 2y + 18a$.

²⁾ At heterotypic metaphase 6 gemini + 1 tripartite chromosome were observed. Thus the complex is written $2n \delta = 12a + x + Y_1 + Y_2$; $2n \varphi = 12a + 2x$.

³⁾ Tetraploid cells were more numerous than octoploid cells, but diploid cells were the most numerous.

⁴⁾ By figure of somatic plate from root-tip.

¹⁾ See foot-note 2 page 136.

²⁾ In this species one pair of chromosomes sometimes passed to the poles in early metaphase before the other chromosomes had started to separate („precursory chromosomes"). Non-disjunction of one pair often gave rise to different numbers of chromosomes in the two daughter nuclei. Doubling of the chromosome number also occurred.

			ICHIJIMA, 1930.

¹⁾ Non-disjunction as well as the precursory behavior of a pair of chromosomes was frequently observed. Sometimes 29 chromosomes were counted at early diakinesis.

²⁾ In this species one pair of chromosomes was smaller than the other six pairs and frequently failed to divide at metaphase, passing to either pole without separation of the two chromosomes.

³⁾ In the embryo-sac-mother-cell division of female plants one pair of heterochromosomes (the W Z pair) was distinguishable.

⁴⁾ Non-disjunction and lagging of chromosomes was observed in this species. There were present chromosomes of two different shapes.

⁵⁾ See foot-note 2 page 137.

⁶⁾ The chromosome behavior was much more regular in this species than in the other tetraploid species.

¹⁾ Classification into sections is according to TAUBERT (1891).

²⁾ Classification is according to ASCHERSON & GRAEBNER, supplemented by Monograph by BUNGE (1869 & 1874) on *Astragalus* and *Oxytropis*.

³⁾ Because the chromosomes were "clumped" on the heterotypic division stages it was difficult to determine the haploid number exactly.

GERANIALES

RUTACEAE

<i>Ruta patavina</i> L.	9	18	CAPPELLETTI, 1930.
---------------------------------	---	----	--------------------

¹⁾ Of 45 plants (cross progeny of F₂ plants used by HÅKANSSON, 1929a (GAISER 1930b) with a double recessive) 19 had 7 free gemini and 26 had 5 gemini and a ring or chain of 4 chromosomes.

²⁾ For 35 varieties examined the haploid number was found to be 20. Two varieties were examined somatically.

³⁾ For 5 varieties examined the haploid number was found to be 11. Two varieties were examined somatically.

⁴⁾ For 5 horticultural varieties examined the haploid number was found to be 11. One variety was examined somatically.

⁵⁾ 4 horticultural varieties were examined.

¹⁾ Classification is according to ENGLER & PRANTL.

²⁾ Some tetraploid cells were found scattered singly amongst diploid cells of both perilem and plerome.

³⁾ The tetraploid cells were found in rows of 10 or 12 in the outermost layers of the perilem.

„ <i>Lamarckiana mut. nidiformis</i>	14 ⁷⁾ $\frac{2}{2}$		HÅKANSSON, 1930b.

¹⁾ Arranged as a chain of 13 + 1 pair of chromosomes.

²⁾ Generally arranged as 7 pairs. Often members of a pair were open and even separated as univalents.

³⁾ Arranged as a ring of 8 + 3 pairs of chromosomes.

⁴⁾ Arranged as a ring of 14.

⁵⁾ Arranged as 7 pairs of chromosomes.

⁶⁾ WEIER (1930), CLELAND & OEHLKERS (1930) found the chromosomes arranged as a chain of 12 plus one pair. CAPINPIN (1930a, b) found the chromosomes in two or more circles, never in a single one.

⁷⁾ Arranged as a chain of 12 plus 1 pair of chromosomes.

	14	GATES & GOODWIN, 1930.
		HÅKANSSON, 1930b.

¹⁾ Generally arranged as a ring of 4 plus 5 free pairs of chromosomes but many variations of arrangement of the 5 pairs occurred.

²⁾ Arranged as a chain of 13 plus 1 pair of chromosomes.

³⁾ Arranged as an open chain of 11 plus 2 pairs of chromosomes.

⁴⁾ Arranged as a ring of 14.

⁵⁾ Arranged as a ring of 6, 1 trivalent plus 3 pairs of chromosomes.

⁶⁾ CATCHESIDE (1930a) found one plant to be triploid with a ring of 21 chromosomes. Usually 10 and 11 chromosomes passed to either pole but occasionally non-disjunction resulted in a 9—12 division. CATCHESIDE (1930b) having reinvestigated found various combinations of univalents; ring-and-rod pairs; chain, Y-shaped, and ring-and-rod trivalents; various quadrivalents and quinquivalents.

⁷⁾ Arranged as a ring of 8 plus 3 pairs of chromosomes.

¹⁾ Arranged as a ring of 8 plus 3 pairs of chromosomes. Ten plants belonging to F₂ and F₃ families showed identical conditions.

²⁾ The 7-ring pairs were frequently interlocked and irregularities in division were frequent.

³⁾ Arranged as a chain of 12 plus 1 pair of chromosomes.

⁴⁾ Arranged as a ring of 6 plus a ring of 8.

⁵⁾ All of the 14 chromosomes were joined but sometimes the chain was open or even broken into shorter pieces.

⁶⁾ Arranged as 2 rings of 4 plus 3 pairs of chromosomes.

⁷⁾ Arranged as a ring of 14.

⁸⁾ Arranged as a ring of 10 and a ring of 4.

¹¹⁾ Arranged as a ring of 6 and a ring of 4 plus 2 pairs of chromosomes.

¹⁾ Classification is according to REHDER (1927).

²⁾ In one plant there were 24 chromosomes at metaphase and in another plant there were 68 chromosomes in the root-tips.

³⁾ At diakinesis there were about 39 chromosomes but at metaphase usually 24 to 26, half of which were bivalents and half univalents.

GALEOPSIS

Subgenus *Ladanum* REICHB.

<i>Galeopsis angustifolia</i> GAUDIN .	8	MÜNTZING, 1930a.
" <i>Ladanum</i> L.	8	" "
" <i>ochroleuca</i> LAMARCK .	8	" "
" <i>pyrenaica</i> BARTL. . .	8	" "

¹⁾ There were apparently 24 paired chromosomes at diakinesis but only 23 could be counted at the heterotypic metaphase.

²⁾ The 36 single chromosomes behaved irregularly at reduction and the pollen was sterile. It was therefore thought to be a hybrid.

³⁾ In one cell about 44 chromosomes were counted.

	$2_3 + 6 + 6\frac{1}{2}$	24	" "
" <i>pubescens</i> × <i>G. speciosa</i> F ₂ F ₃	$9 + 6\frac{1}{2}$	16	" 1930b.
" <i>Tetrahit</i> × <i>G. bifida</i> F ₁ ⁴⁾	16		" 1930a.

¹⁾ The haploid number was determined in several types of the species.

²⁾ Chromosome affinity and reduction division was quite normal.

³⁾ This number was found in the spontaneous hybrid also.

⁴⁾ This number was found also in one extreme dwarf plant of the cross.

⁵⁾ Of 6 F₂ plants 5 were diploid and one was triploid.

⁶⁾ The reduction division was quite normal, though it showed some minor irregularities.

¹⁾ Some of the extremely narrow-leaved and broad-leaved F_2 and large-flowered F_3 plants showed the same number ($n = 16$).

²⁾ Four varieties described as: long red, large red, long yellow and large yellow from Messrs. Sutton & Sons were used. Also four varieties described as: pigment gros long changeant, pigment jaune demi-long d'Antibes, pigment jaune long, pigment cerise from Messrs. Vilmorin et Cie.

³⁾ Plants exposed to change of temperature showed irregular meiosis with varying numbers of chromosomes in the gametes as n , $n-a$, $n+a$, $2n$, $2n+a$, $3n$, $3n+a$ and $4n$, where n is any number smaller than 12.

" <i>Tabacum</i> fluted carmine	$23 + 1_1$ ⁵⁾		" " "

¹⁾ The majority of cells had 24 (the diploid number) of chromosomes.

²⁾ Irregularities in meiosis were found.

³⁾ Certain areas in root-tips showed 48 chromosomes.

⁴⁾ One plant among 1470 was isolated because of a dwarf habit and was found to be a haploid plant.

⁵⁾ The univalent chromosome is designated an F. chromosome

<i>Nicotiana Tabacum</i> (scion on <i>Datura Wrightii</i> . .	24 ⁴⁾	KOSTOFF, 1930a.

¹⁾ The modified univalent chromosome is designated F-co.

²⁾ The number of units is the result of attachment, translocation, deletion, fragmentation and altered valency of the chromosomes.

³⁾ At meiosis of first generation progenies from X-rayed plants, fragmentation, non-conjunction and conditions of unpaired and additions of fusions of chromosomes occurred. The result most frequently gave monosomics.

⁴⁾ Irregularities in meiosis were found.

¹⁾ Irregularities in meiosis were found.

²⁾ Where a fractional number with denominator = 2 is used from KOSTOFF, 1930d the numerator used is the sum of the chromosomes in late heterotypic metaphase. This plan was adopted since the valency of numbers in early heterotypic metaphase was not designated.

¹⁾ This plant consisted of three shoots, two of which were triple B trisomic ($2n = 9$) and the third was normal diploid ($2n = 8$).

²⁾ This plant showed varying numbers of chromosomes in different cells of the root-tip and along with the normal chromosomes were from 1 to 4 atypical chromatin rings or discs.

³⁾ Only rarely was there any association of chromosomes as pairs.

⁴⁾ Rarely 2 bivalents and 6 univalents were found and rarely a trivalent, 2 bivalents and 3 univalents.

¹⁾ This plant was thought to be a hybrid because of the lagging chromosomes on the spindle.

²⁾ This species was introduced from Denmark.

³⁾ Introductions from Caucasus, Georgia, Univ. of California, Montana Agr. Exp. Sta. and those of Univ. of Alberta showed root-tips with 28 chromosomes.

Introductions from Omsk Exp. Sta., Siberia had 14 chromosomes.

Of introductions from Krasnyi Kut Exp. Sta., U. S. S. R. three strains had 14 and one had 28 chromosomes.

One strain from Dom. Range Exp. Sta. at Manyberries had 29 chromosomes.

⁴⁾ This species was introduced from Russia.

¹⁾ This species was introduced from western Canada.

²⁾ This species was introduced from Russia.

³⁾ This species was introduced from Denmark.

⁴⁾ This species was collected in England.

⁵⁾ Nine forms from Western Canada had 42 somatic chromosomes and 21 bivalents. Of five plants obtained from Russia, three gave counts of 42 somatic chromosomes, one counts of 35 and another either 34 or 35 chromosomes. A strain from Copenhagen had 42 somatic chromosomes.

⁶⁾ Ten strains from Western Canada showed 56 somatic chromosomes.

⁷⁾ Of four plants from Western Canada studied, two had 28 and two had 56 somatic chromosomes.

⁸⁾ Of five plants from Western Canada that were examined two had 14 somatic chromosomes whereas in the three other plants a high percentage of cells showed 1-3 extra chromosomes.

¹⁾ Of thirty seven plants from Western Canada, representing a wide range of variable forms, all but one showed 28 somatic chromosomes and in seven of them the 14 bivalents were seen at heterotypic metaphase. In one plant 21 somatic chromosomes and in meiotic figures 13 to 17 univalent chromosomes were found.

²⁾ This species was introduced from Denmark.

³⁾ The chromosomes were associated as 14 bivalents or 12 bivalents + 1 quadri-valent or 12 bivalents + 1 trivalent + 1 univalent but at the poles of the spindle 14 chromosomes were always counted.

⁴⁾ The plant material studied showed such „monstrosities” as unusual branching. KATTERMANN (1930).

⁵⁾ There was some trace of trivalents.

⁶⁾ Classification of species used by SENJANINOVA-KORCZAGINA was determined by ZHUKOVSKY.
